## DIGITAL ACADEMY

MM level 1 - Process overview

Novembre 2020

- **MM Global view**

- Have a global logistic view in SAP
- Understand MM integration with other modules

- **Basic concepts of MM**

- Understand purchasing module and basic elements.
  - General flow
  - organizational structure
  - Basic master data (material master data, supplier data, material info records, source list)

- **MM purchasing flows**

- Type of procurement
- end-to-end purchasing flow

- **Summary of transactions**

- **Technical**

- **Q&A**

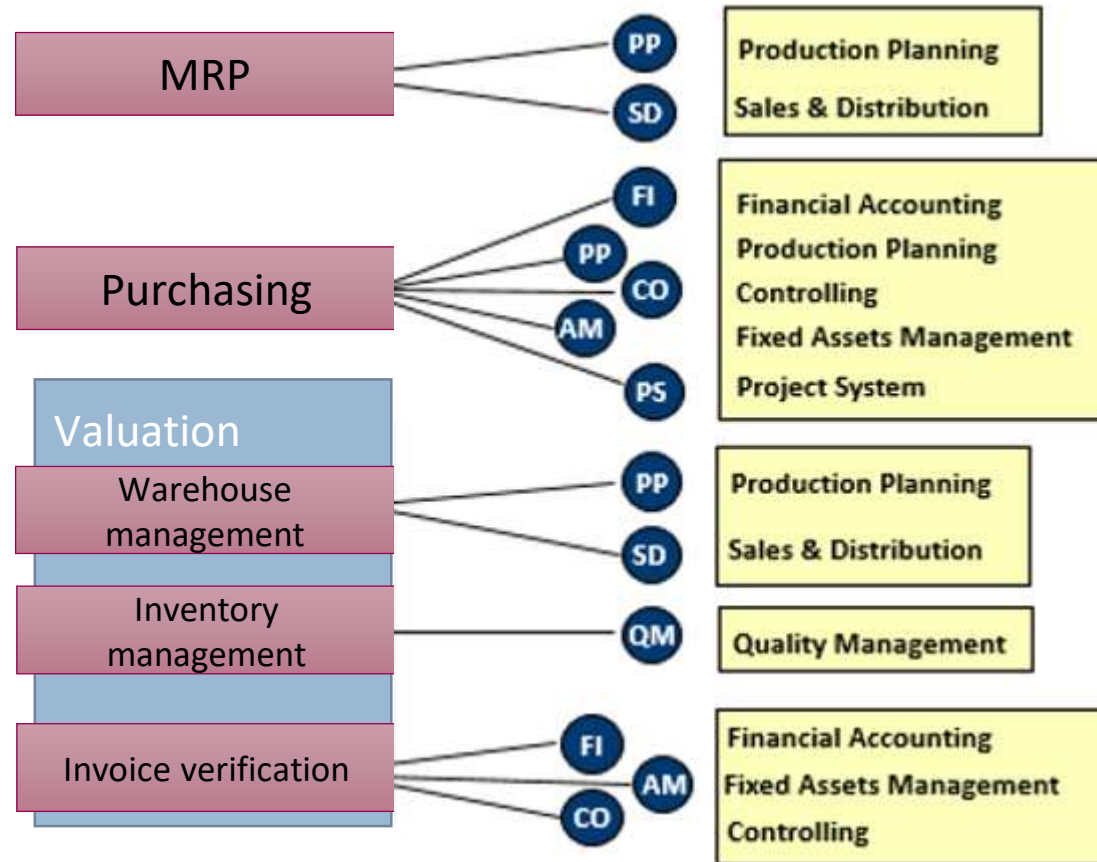

## ■ **MM Global view**

- Have a global logistic view in SAP
- Understand MM integration with other modules

**SAP MM** is one of the modules of SAP that deals with material management and inventory management. ... It deals with the Procurement Process, Master Data (Material & Vendor Master), Account Determination & Valuation of Material, Inventory Management, Invoice Verification, Material Requirement Planning, etc.

Material management process ensures that is never a shortage of materials or any gaps in the supply chain process of the organization, it consists of all master data, system configuration, and transactions to complete the procure to pay process.

# MAIN FUNCTIONALITIES

The MM domain covers all the following functional requirements:

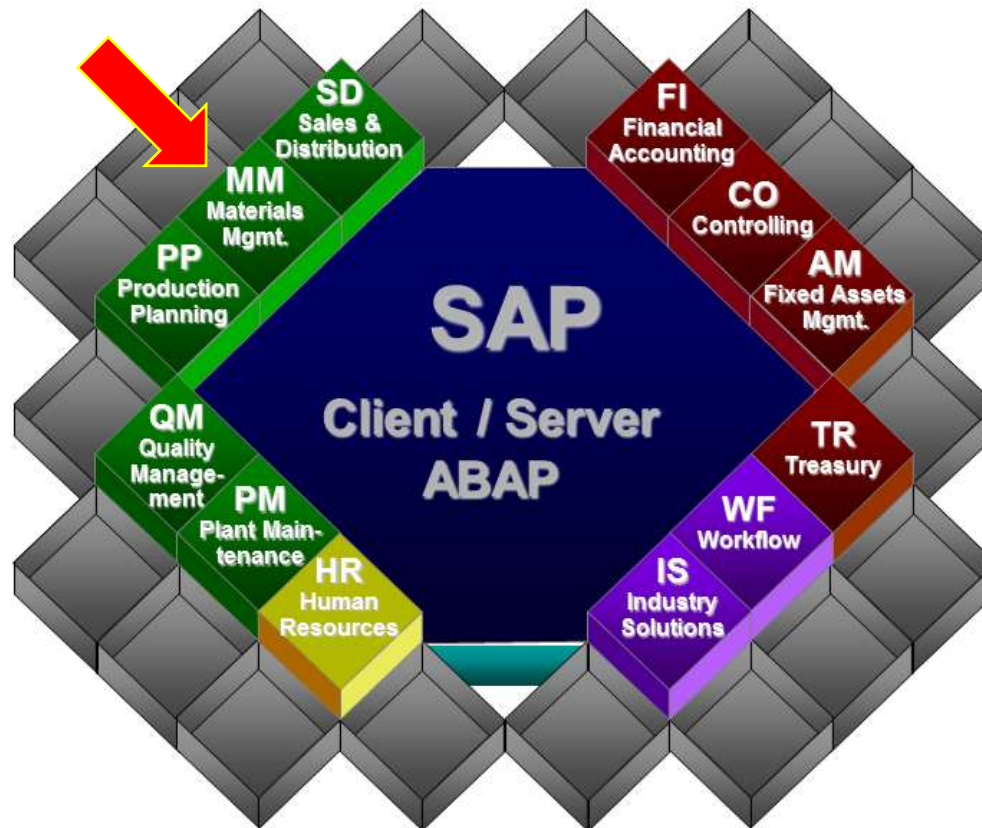

- Purchasing management (integration with PP, FI/CO, PS...)
- Valuations (inventory valuation, invoice verification...)
- The MRP (for production and distribution)

The MRP run determines requirements in:

- External procurements (purchases)
- Internal procurements (in-house production)

# MM integration with the other modules

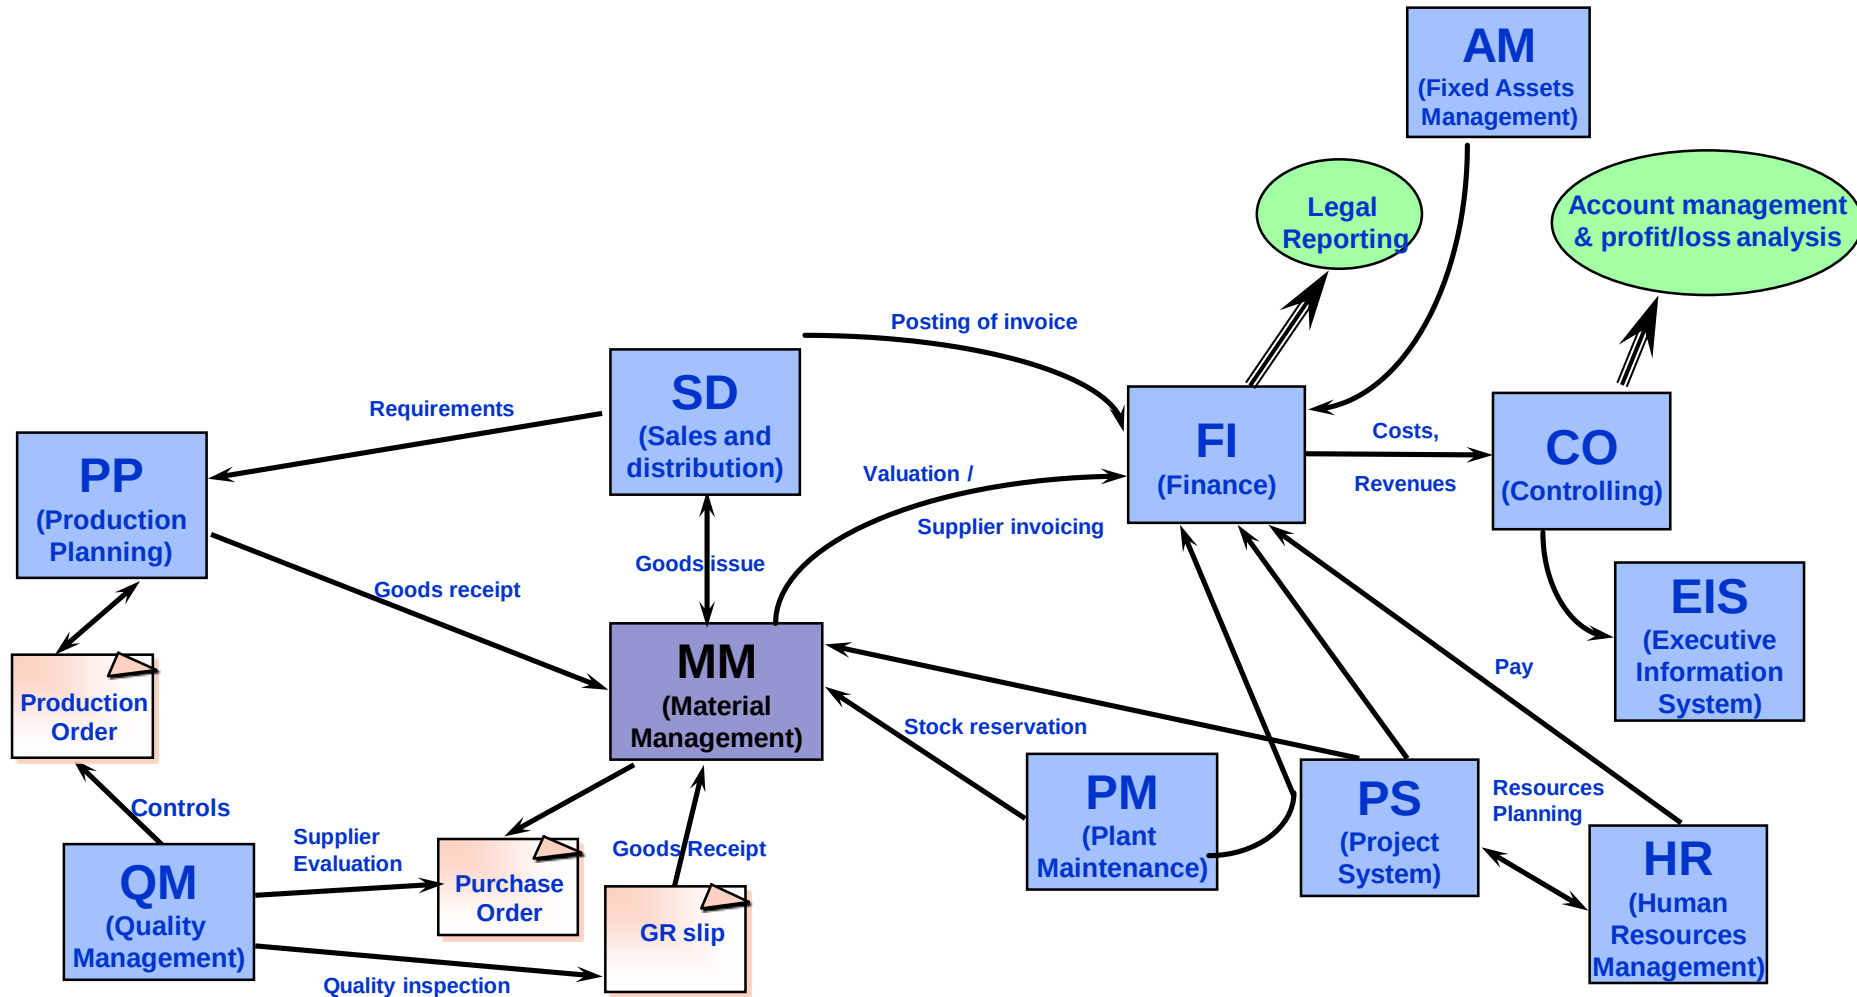

## MM in the SAP Modular Landscape

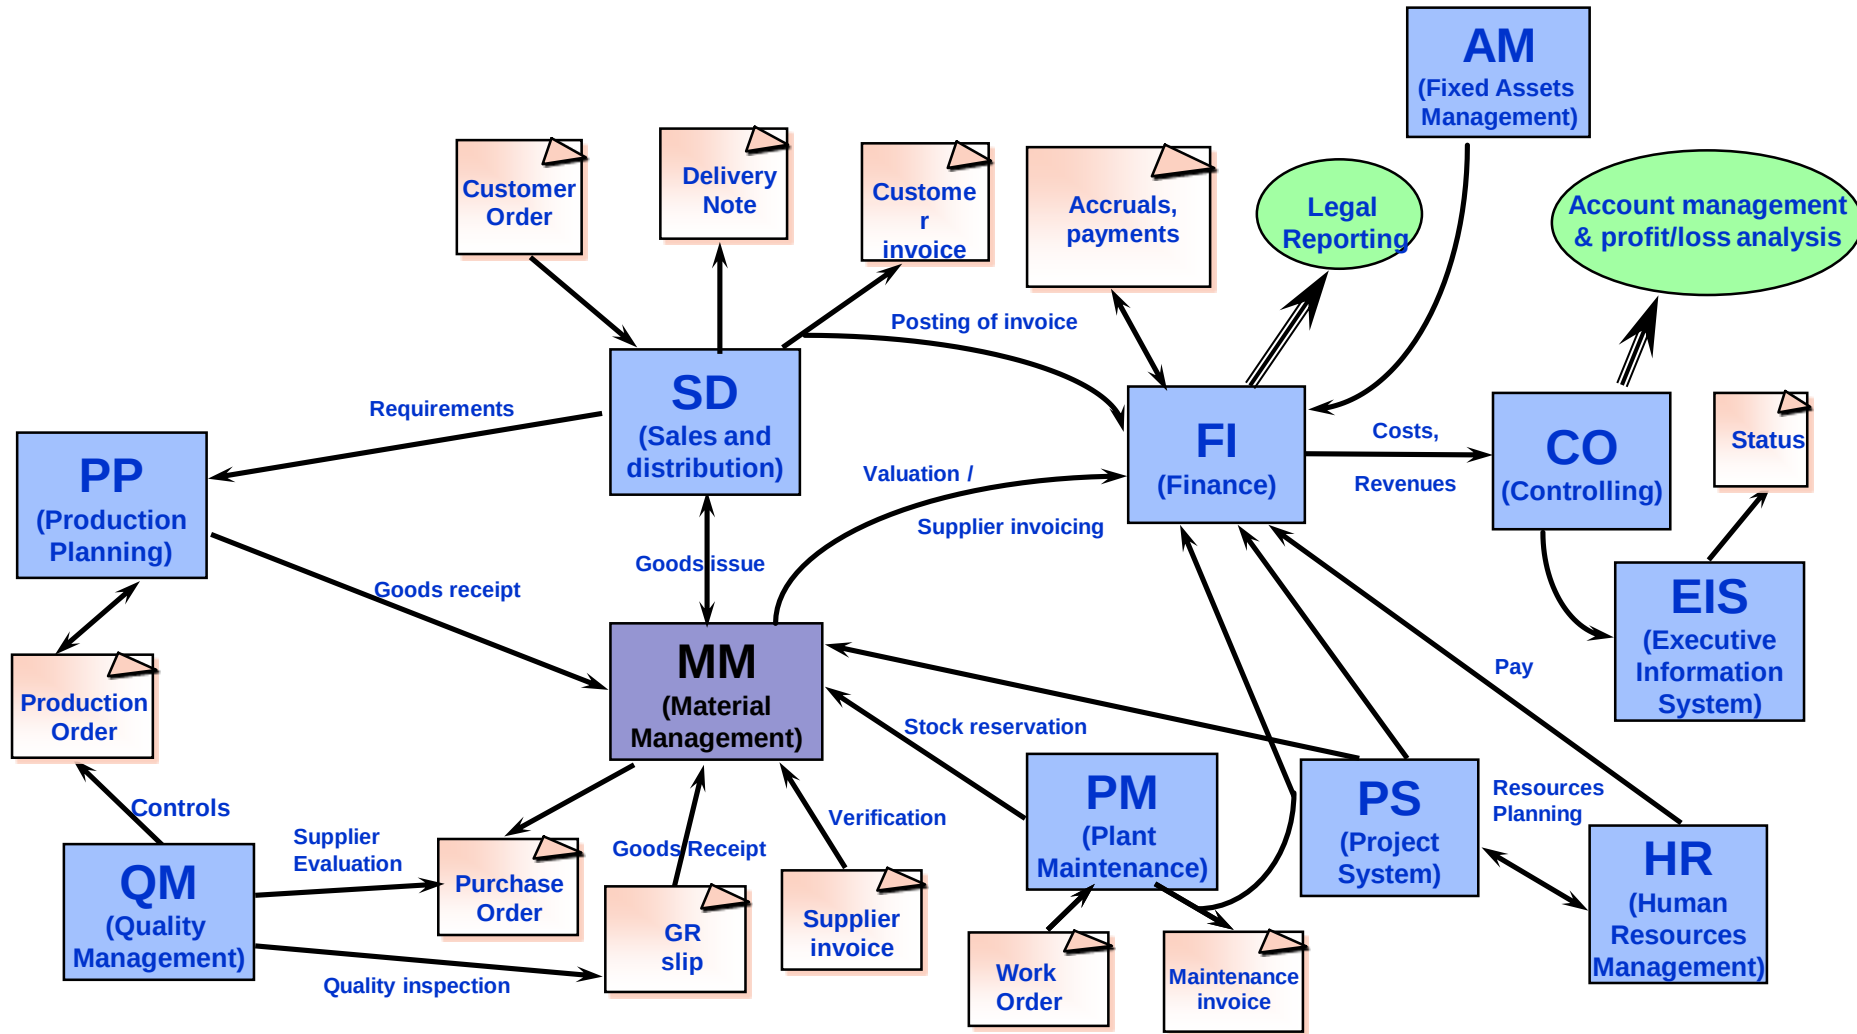

The MM module is interconnected with the other SAP modules:

- **Modules linked to logistics:** SD, WM, PP
- **Modules linked to finance:** FI, CO, AM
- **Modules linked to project management:** PS
- **Quality management module (QM)**
- **Plant maintenance module (PM)**
- **Customer support and after sales support module : CS**

# MM integration with the other modules

# MM integration with the other modules

# MM integration with the other modules

**SAP MM** is one of the modules of SAP that deals with material management and inventory management. ... It deals with:

- **Master Data Management (Material, Vendor & purchasing info records).**
- **Material Requirement Planning**
- **Purchasing**
  - *Purchase requests*
  - *Purchase order*
  - *Contracts*
- **Invoice verification**
- **Stock Management**
  - *Good receipt and Good issue*
  - *Returns*
  - *Transfer*
  - *Reservations, adjustments*
- **Warehouse Management**
- **Reporting**
  - *Analyzes, forecasts*
  - *Suppliers evaluation*

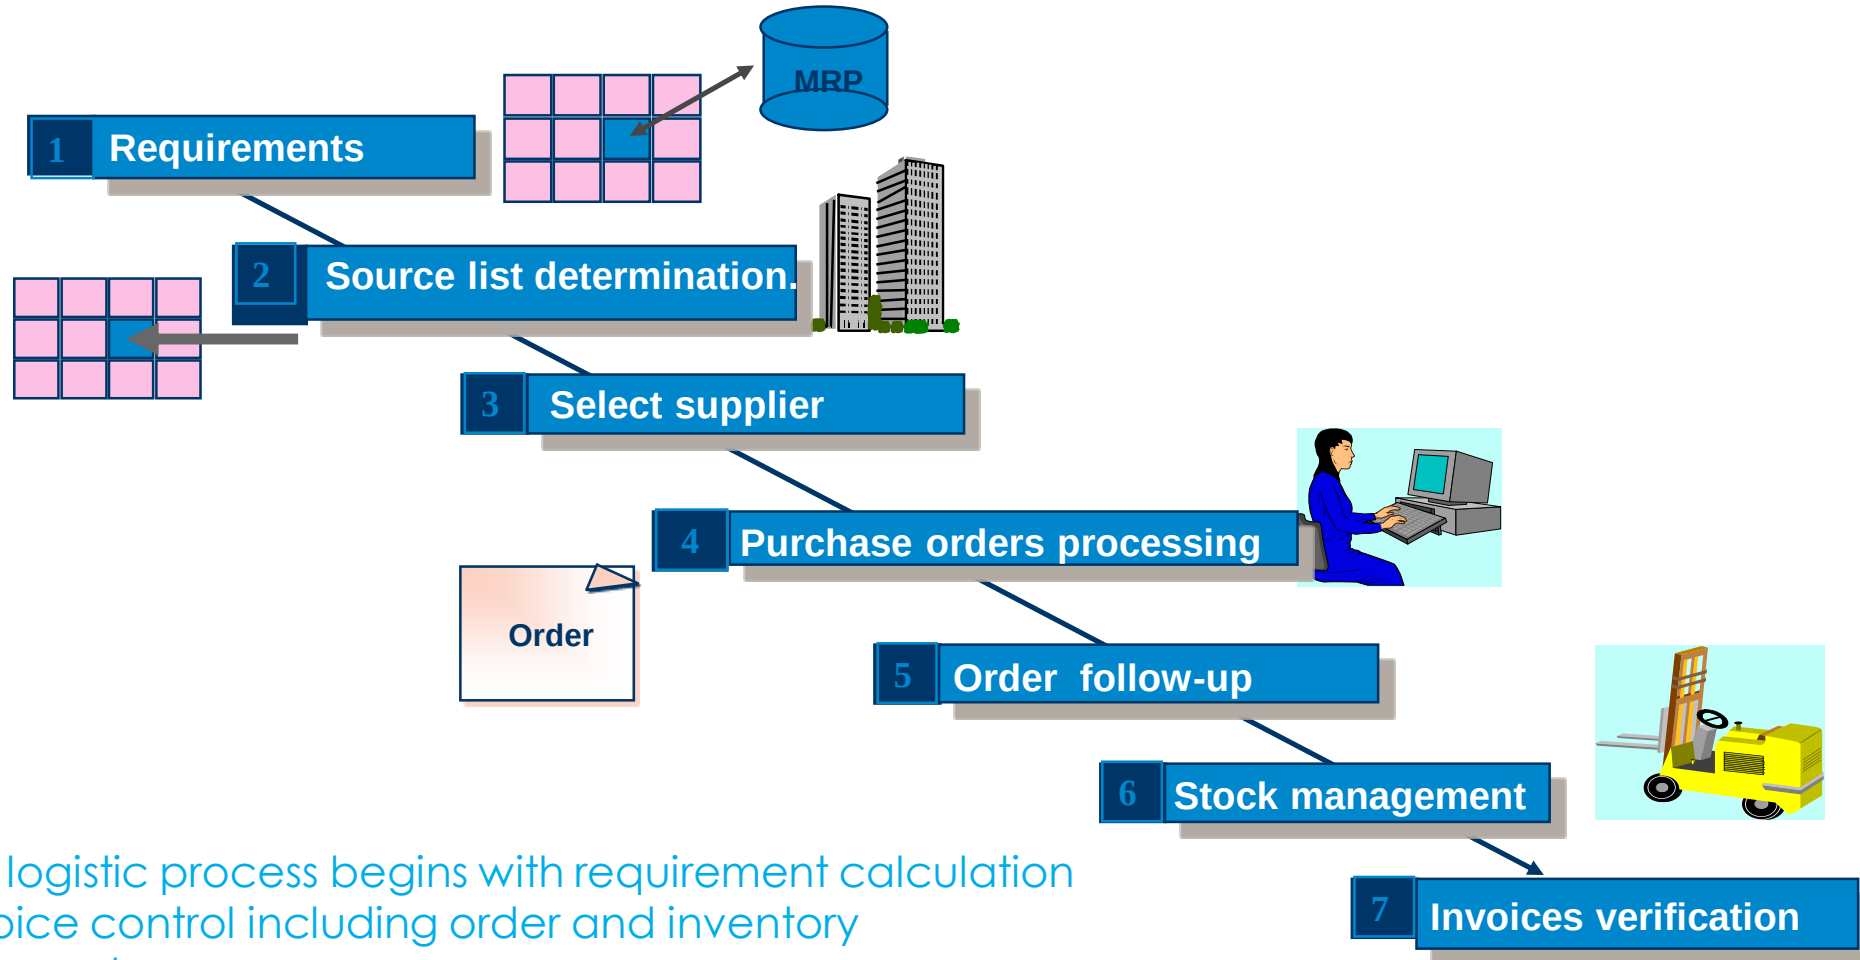

## ■ Basic concepts of MM

→ Understand purchasing module and basic elements.

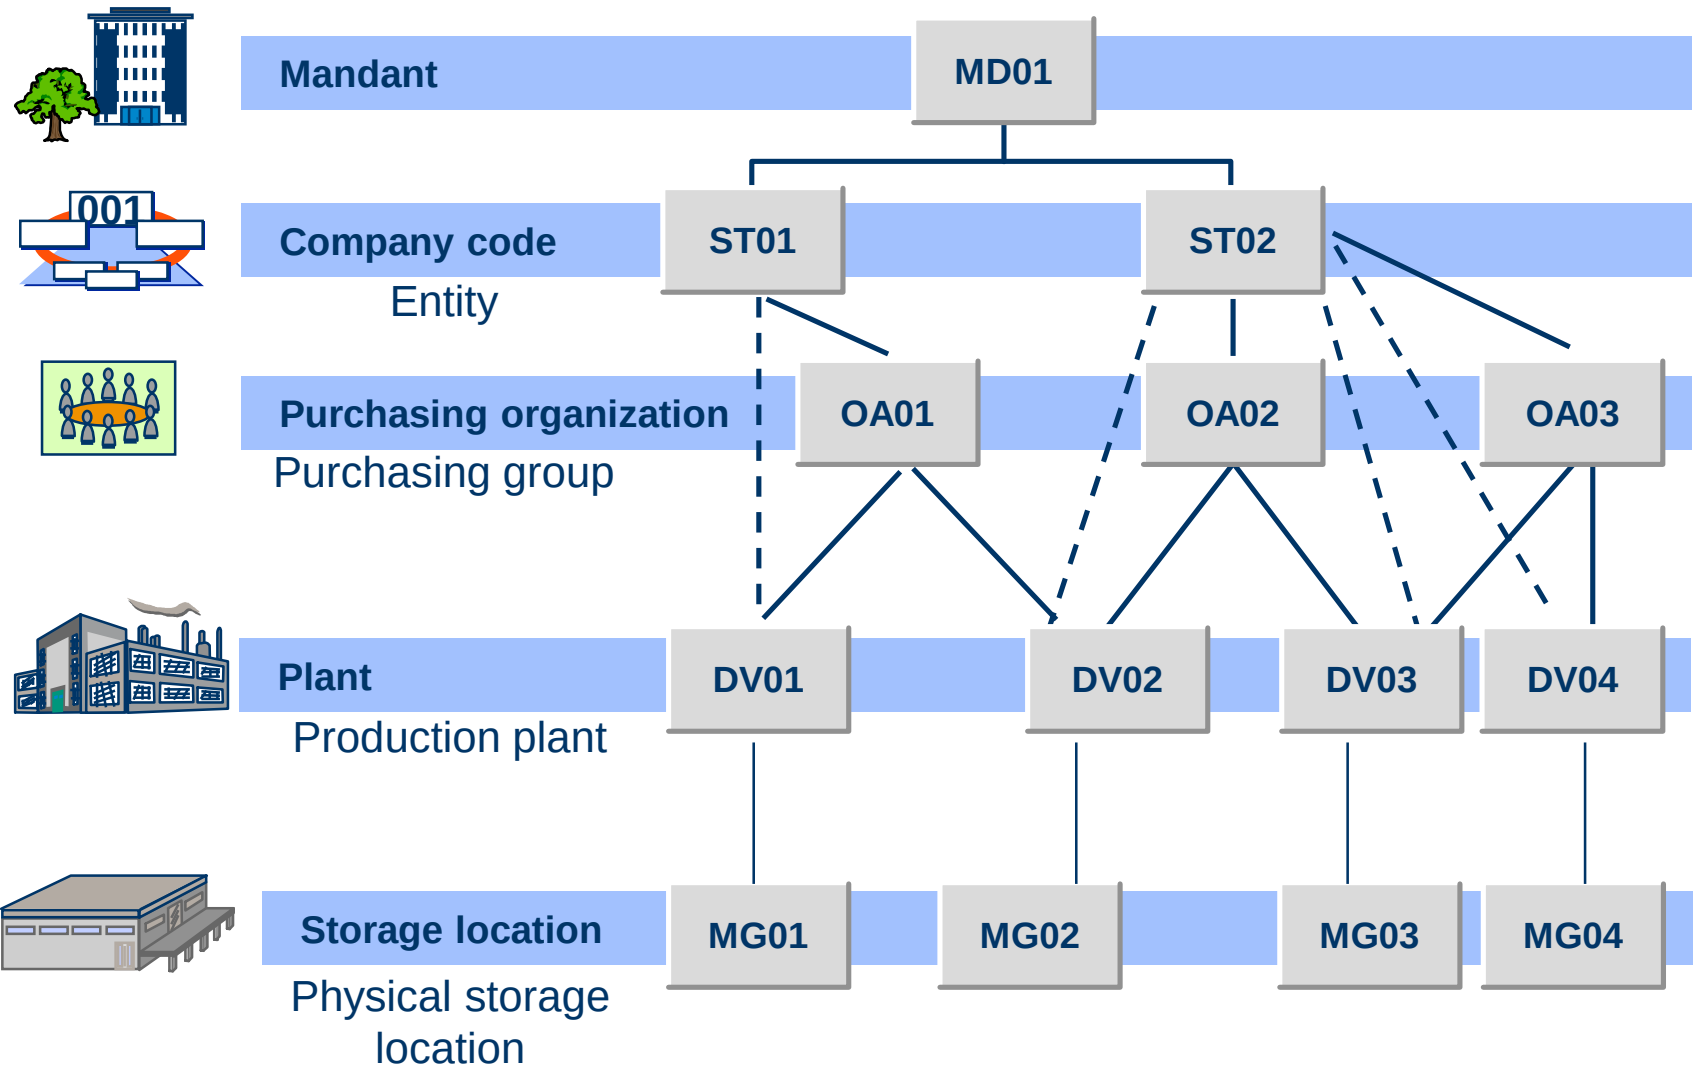

- General flow
- organizational structure
- Basic master data (material master data, supplier data, material info records)

# General MM flow

The MM logistic process begins with requirement calculation until invoice control including order and inventory management

# Enterprise Structure

# Entreprise Structure

## ■ Définitions

- **Mandant (SAP)**

- **Company code**

- independent accounting entity within a group (mandant)
- 1 or more per mandant

- **Plant**

- production plant or branch within a company.
- 1 or more per company

- **Storage location**

- Physical storage location for Material (inventory)

- **Purchasing organization**

- Unit responsible for purchasing goods and services
- 1 or more per company
- For 1 or more plants (from different companies)

- **Purchasing group**

- Group of Person responsible for one specific purchasing organization

## ■ Basic concepts of MM

→ Basic master data (material master data, supplier data, material info records, source list)

# Material Master Data

## ■ Definition

- Details of the articles that a company procures externally or produces internally  
=> unit of measure, designation of an article
- Other modules of the Logistics component of SAP also access article data (purchase, sale, stock, accounting, etc.)

## ■ Material management

- Creation at the first installation of the MM module.
- Information management by departments (views): creation and modification centrally or by individual departments.
- **MM01** – Create, **MM02** – Change, **MM03** – Display

# Material Master Data

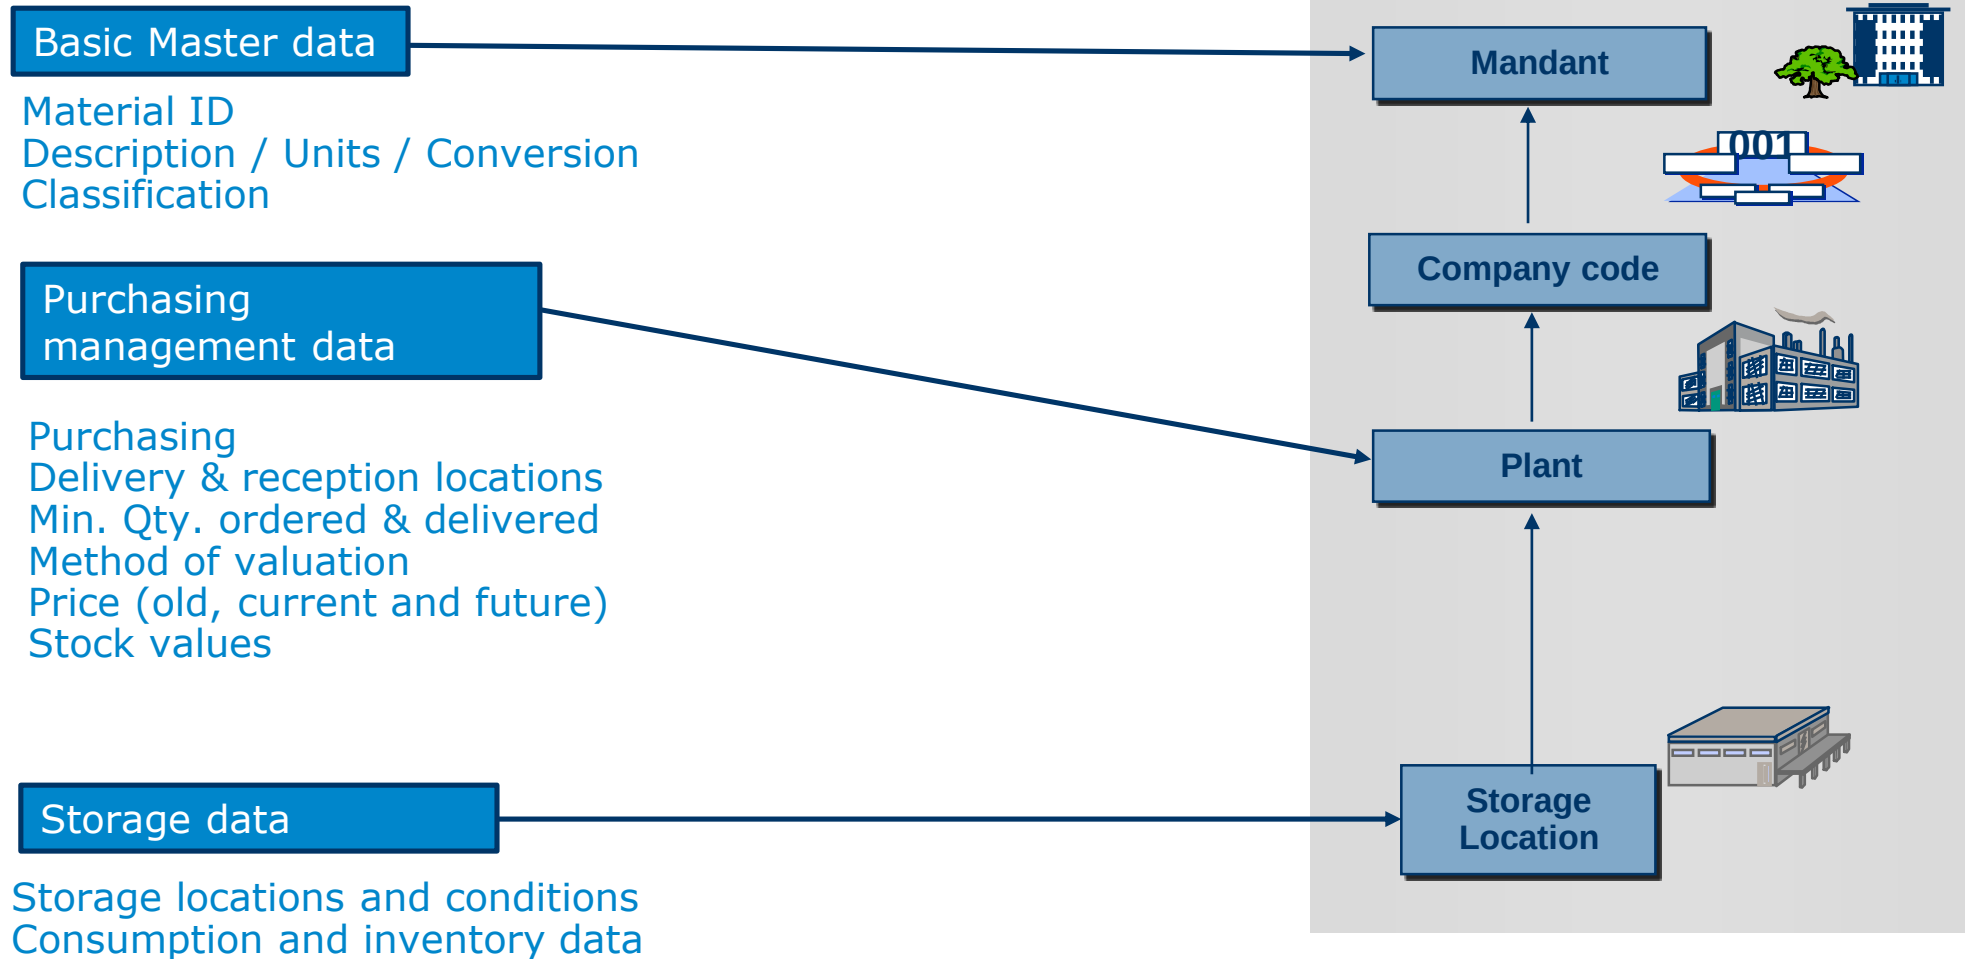

## ■ Views per domain

- Basic data
- Classification
- Sales → SD
- Purchasing → MM
- Material requirement planning
- Storage data
- Warehouse management
- Warehouse management → WM
- Quality management → QM
- Accounting → FI

# Material Master Data

## ■ Material Master data structure

# Vendor Master Data

## ■ Definition

- Vendor = partner from whom you purchase goods and services. There are two types of vendors in the R / 3 System:
  - Vendor with internal id with sap internal numbering
  - Vendor with external id entered manually.
- Vendor = **Credit account** → Accounting information, (appropriate collective account in the general ledger system).
- Vendor = **object of orders** → Purchasing information.
- **Vendor Master record** = all the information related to suppliers, managed by both Accounting and Purchasing systems.
- To be created for each **purchasing organization** and each **company code**.  
*As soon as you create the original master record for the supplier, you can assign the supplier to one or more purchasing organizations or companies.*

# Vendor Master Data

## ■ Vendor Master data structure

### Basic general data

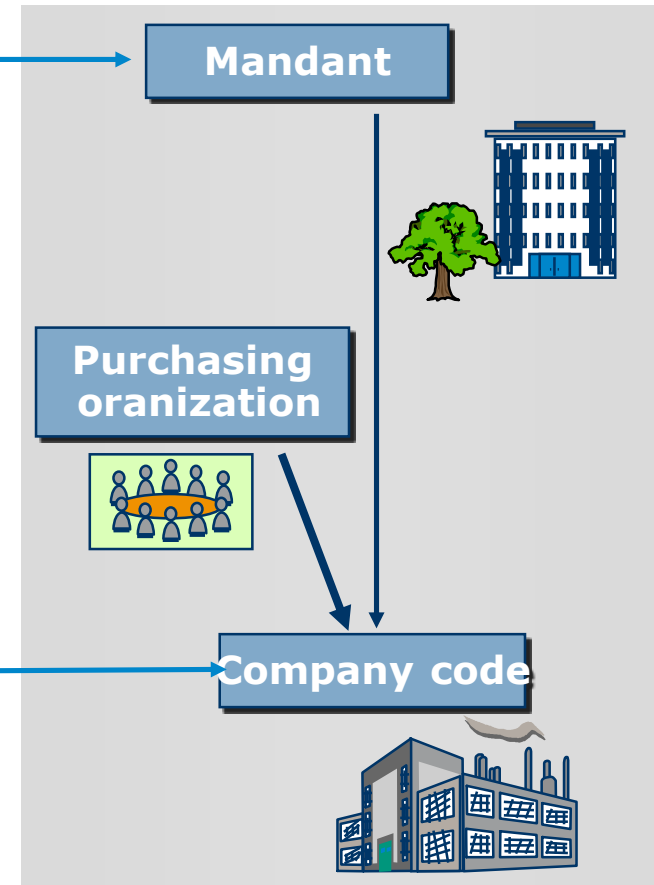

Address (name, address, country...)  
control (SIRET, SIREN, vat number...)  
Payment data (bank details...)  
Contact

### Purchasing organization data

Purchasing data (currency, transport, invoice verification...)  
Partners roles (vendor, goods supplier..)

### Company data / accounting

→ Supplier accounting management  
Account maintenance (general account, etc.)  
Payment transactions (terms and method of payment, etc.)  
Correspondence (reminder data, accounting manager, etc.)

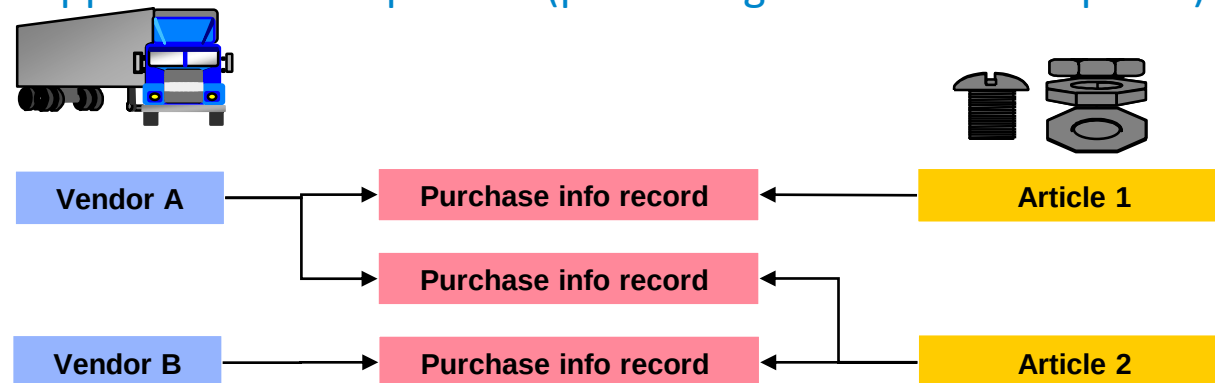

# Purchasing info record data

## ■ Definitions

The Info-Purchasing Sheet corresponds to a Material - Vendor pair.

There can only be one purchasing info record in the system per Material / Vendor pair

- Its purpose is to manage the purchase information of a given material from a given vendor :
  - Prices, price conditions, etc.
  - Delivery times, buyers group, etc.
- The Info-Purchasing record therefore allows:
  - to provide a repository of potential suppliers of a product.
  - to manage the supplier's price histories.
  - optimize the supplier allocation process (processing of Purchase Requests).

# Source List

## ■ Definitions

The source list is used in the administration of sources of supply.

It specifies the allowed (and disallowed) sources of a material for a certain plant within a predefined period. Each source is defined by means of a source list record.

## ■ Use

### **Manual maintenance: ME01 transaction**

- ❖ Use this method if you have to make numerous changes to, or new entries in, the source list.

### **Maintenance from within an info record**

- ❖ With this procedure, you can enter a vendor in the source list when creating or changing a purchasing info record.

### **Automatic maintenance**

- ❖ You can have a source list for a material created automatically. The system creates a source list record for each info record that has been defined for the material or for each outline agreement item in which the material is specified.

# Source List

## ■ Prerequisites

Before you create a source list, you must consider the following points:

- Material and plant: In each source list, you must enter the material number and the relevant plant key for each source.
- Validity period: Consider for which period the source list is to be valid. You can define several validity periods.
- Source list requirement for plant: If a source list requirement has been defined for a plant, you must maintain the source list for each material in the plant before a material can be procured for the plant.

## ■ **MM purchasing flows**

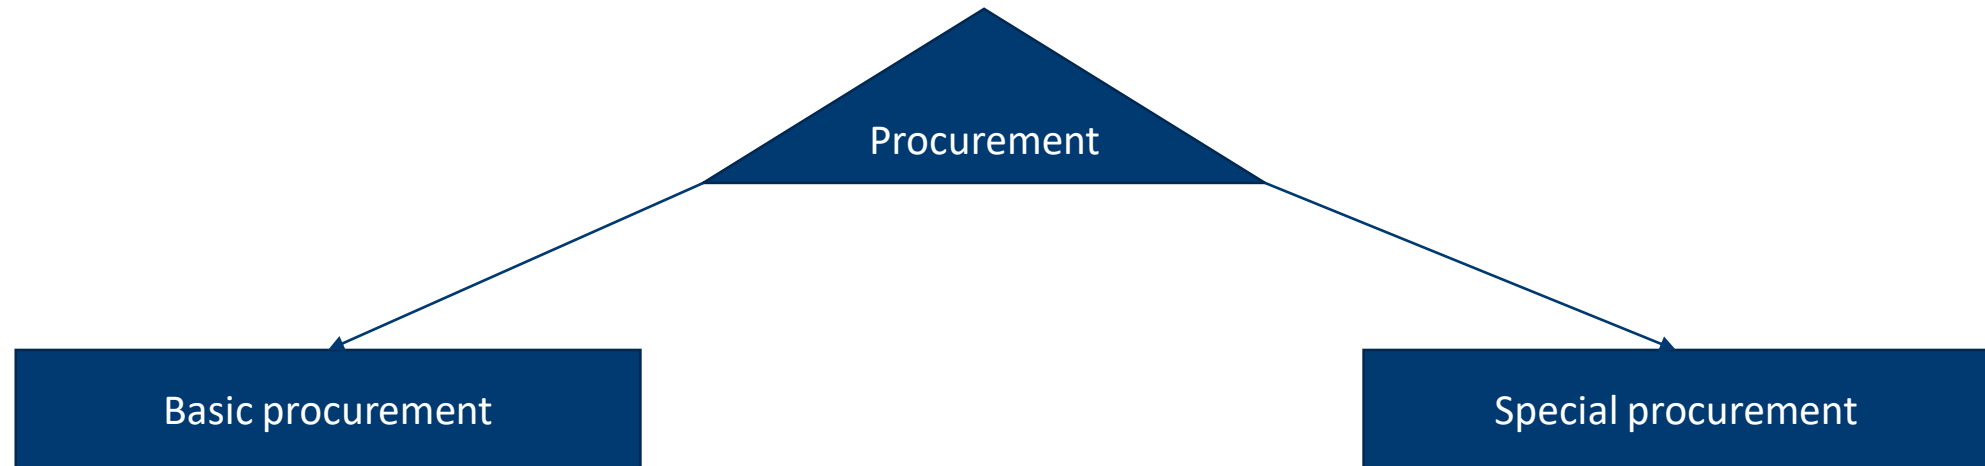

→ Type of procurement

→ end-to-end purchasing flow

# Types of procurement in SAP MM module

There are two types of procurement:

- **Basic procurement**
- **Special procurement**

# Types of procurement in SAP MM module

## Basic procurement

The procedure of buying the right material and services in an appropriate quantity at the lowest rate and at the right time is referred to as **Basic Procurement**.

There is various procurement lifecycle which is as follows:

- **Gathering Information:** The Procurement Process initiates with the collection of details about a product and its quantity. After that according to the required products and services, suppliers must be contacted.
- **Suppliers:** Based on the demand, suppliers are contacted and asked to fulfill the demand.
- **Consumption, Maintenance, and Disposal:** Products and services get evaluated according to their performance. Based on their performance, it gets determined whether the order will get repeated from the same supplier or a new supplier will be contacted.

# Types of procurement in SAP MM module

## Special Procurement

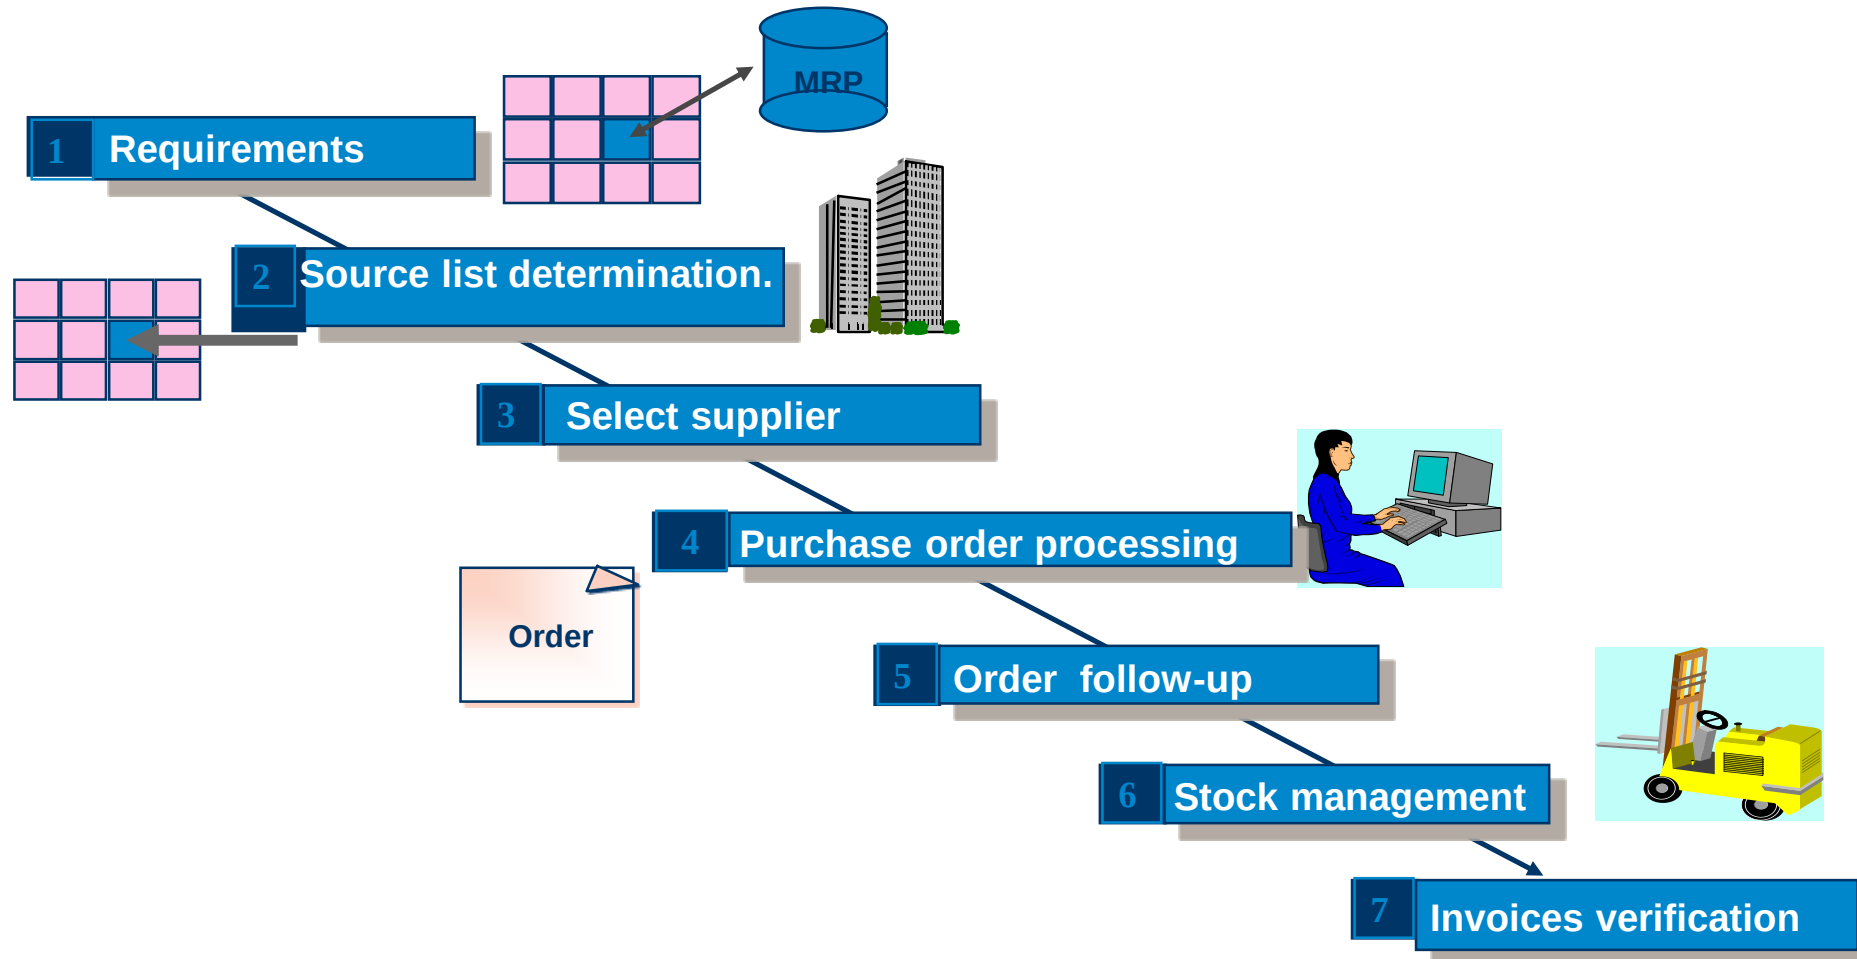

Every business organization requires materials or services to satisfy their business needs. The process of acquiring materials and services is called procurement. Different steps utilized to acquire materials as well as services that form a MM Circulation in the sap procurement cycle. The steps of MM circulation in SAP are:

Types of special procurement and unique stocks are:

- **Consignment Stocks:** The material which is available at store premises is known to be consignment stocks. This material belongs to the seller, but to use it you have to pay the vendor.
- **Third-party Processing:** In third-party processing, the company passes its orders to the vendors who deliver them directly to the customers. These orders are updated inside purchase orders, purchase requisitions, and sales orders.
- **Pipeline Handling:** In pipe handling, the material is not stored by the company; rather, it is stored by the vendor itself. The material is ordered from the vendor whenever it is required by the company.
- **Stock Transport Order:** When one plant requires some goods, it orders them from another plant of the company. These goods are obtained using the stock transport order. The transfer of goods can monitor using this stock transport order.

# MAIN PURCHASING FLOWS

General MM flow (Direct): The supply chain extends from the requirement definition to the invoice verification, including purchase orders and inventory management.

# MAIN PURCHASING FLOWS

## 1- Determination of Requirements

**Requirement determination:** it is the primary step in the Procurement Lifecycle. A company identifies the number of materials or services needed. After the determination of the need, a list of products is created that is accepted by the senior authority to procure. You can enter purchase requisitions yourself, or they can be generated automatically by the materials planning and control system(MRP).

*Transactions*

**MD01** – MRP run **MD02** – Sing Item MRP run **MD04** – Stock/Requirement list

**Purchase Requisition:** An organization collects all its requirements, and after that, a list of requirements is made that is provided to the purchasing organization to acquire the products mentioned in the list.

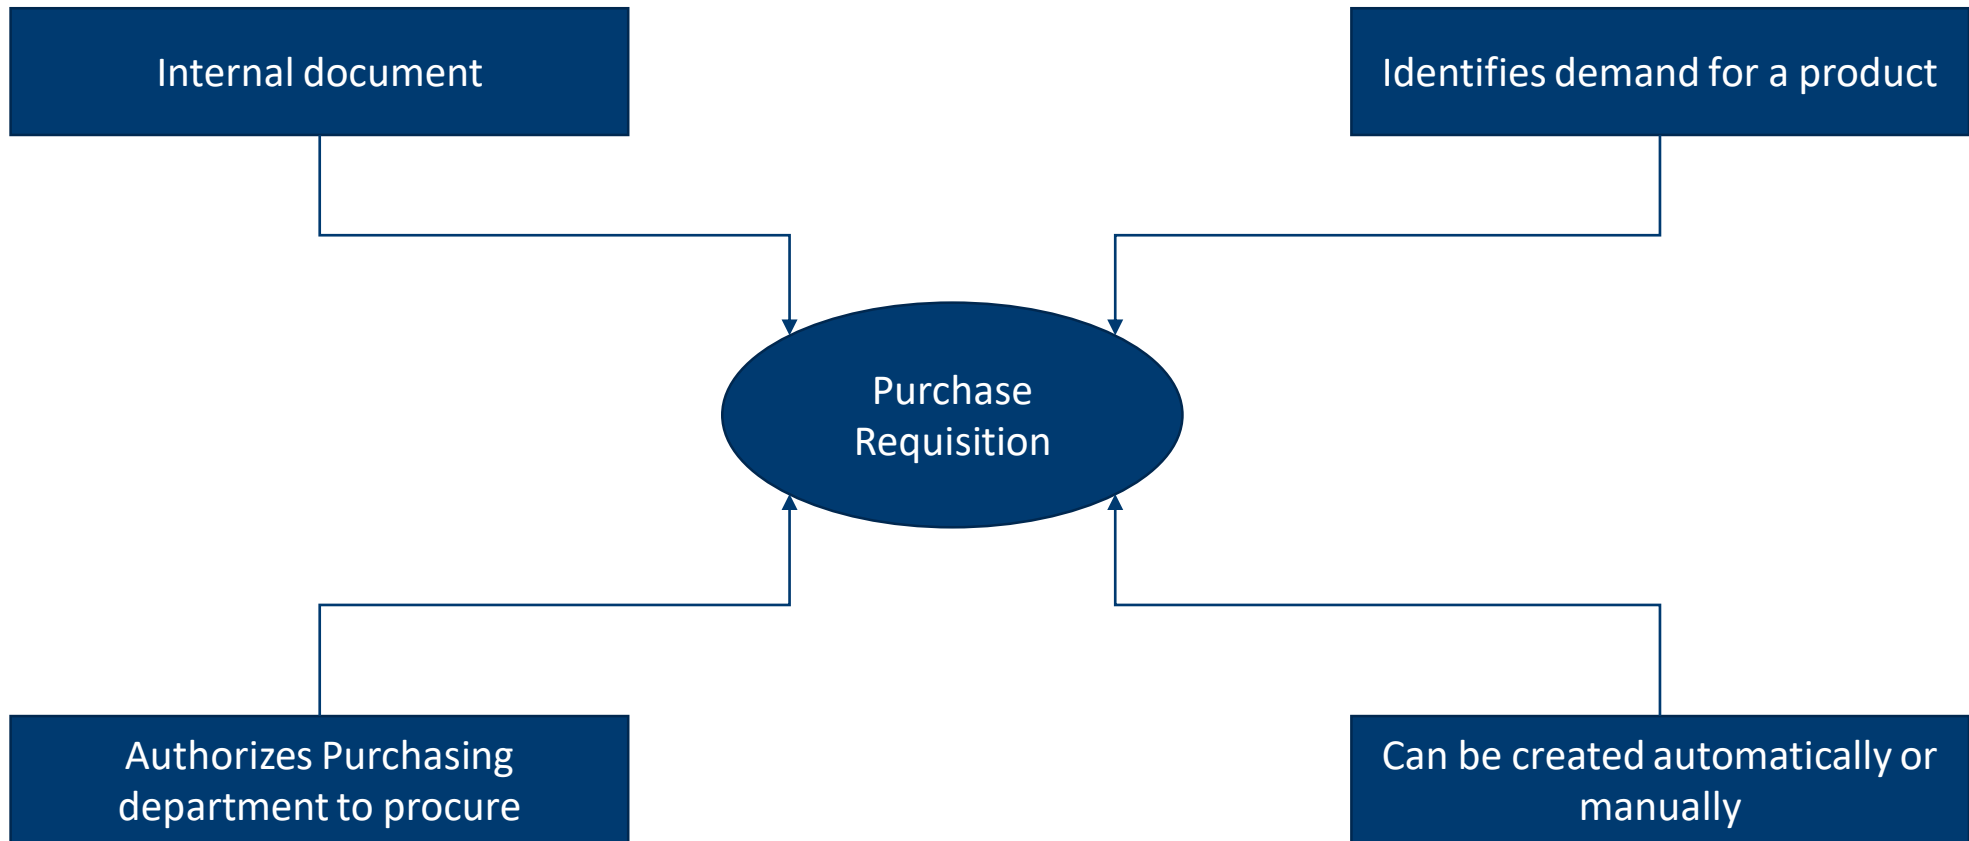

First Purchase requisition has to made to purchase department whoever the product need by the user or production department.

*Transactions*

**ME51N** – Create **ME52N** – Change **ME53N** - Display

# MAIN PURCHASING FLOWS

## 1- Determination of Requirements

## 2- Source list Determination

### Process of Source List Determination

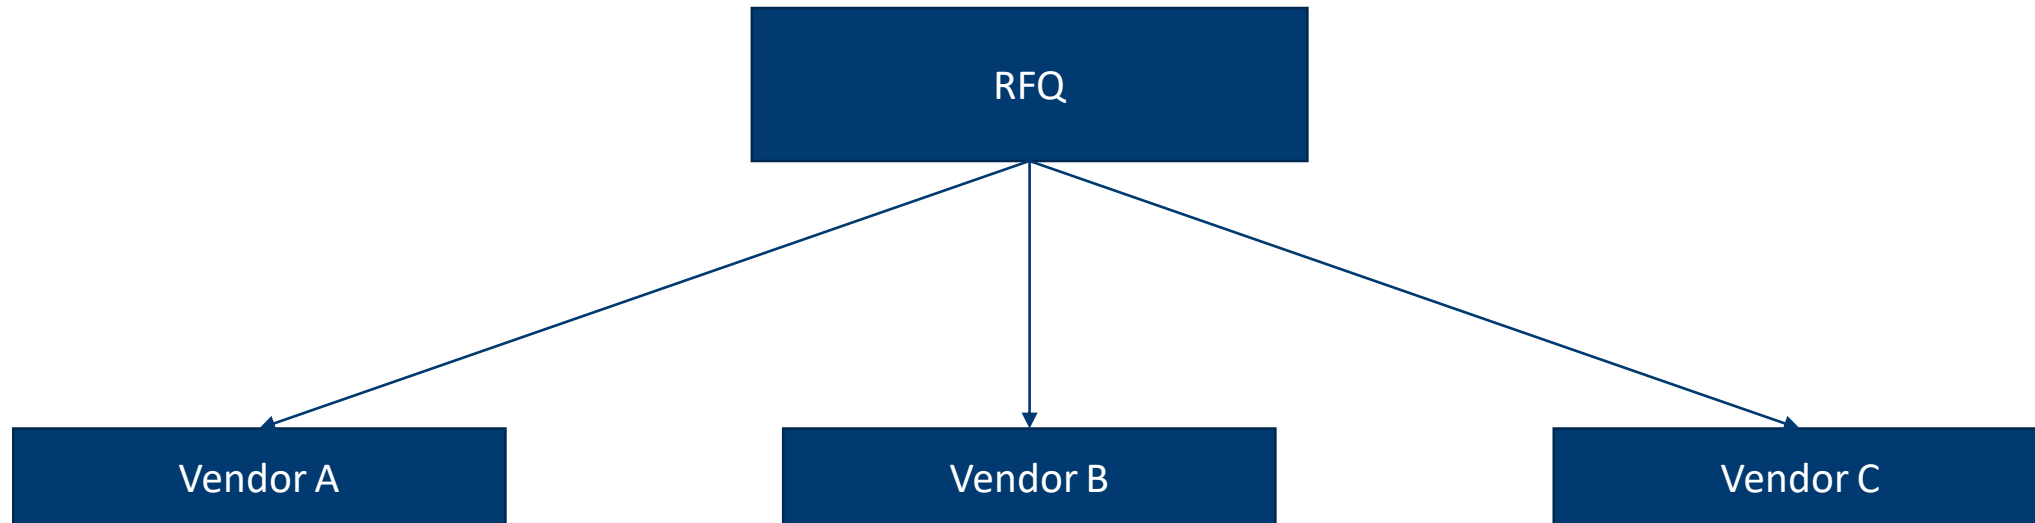

Following is the order of priority to search the source.

- **Quota arrangement** – Quota arrangement helps to automatically identify the vendor and allocate the quantities to the vendor
- **Source List**
- **Purchasing Info record/outline agreement** – It is created for the combination of material, vendor and purchase organization. (details in part **Vendor Selection and Comparison of Quotations**)

# MAIN PURCHASING FLOWS

## 2- Source Determination: *Quota arrangement*

Request for Quotation (RFQ) : invites quotations from sourcing vendors listing terms and conditions for supply for goods and/or services

## 2- Source Determination: *Source List*

In the source list, it is required to specify which source of supply is valid for a certain period of time. It is also possible to specify a preferred source as fixed for a certain period in the source list. In automatic source determination, the system will then suggest just this source, even if other potential sources exists.

*Transaction **ME01***

## 3- Vendor Selection and Comparison of Quotations

The system is capable of simulating pricing scenarios, allowing you to compare a number of different quotations. Rejection letters can be sent automatically.

After the quotations are entered, you can compare them to select the best available offer at this moment. we can compare the quotations in transaction code ME49.

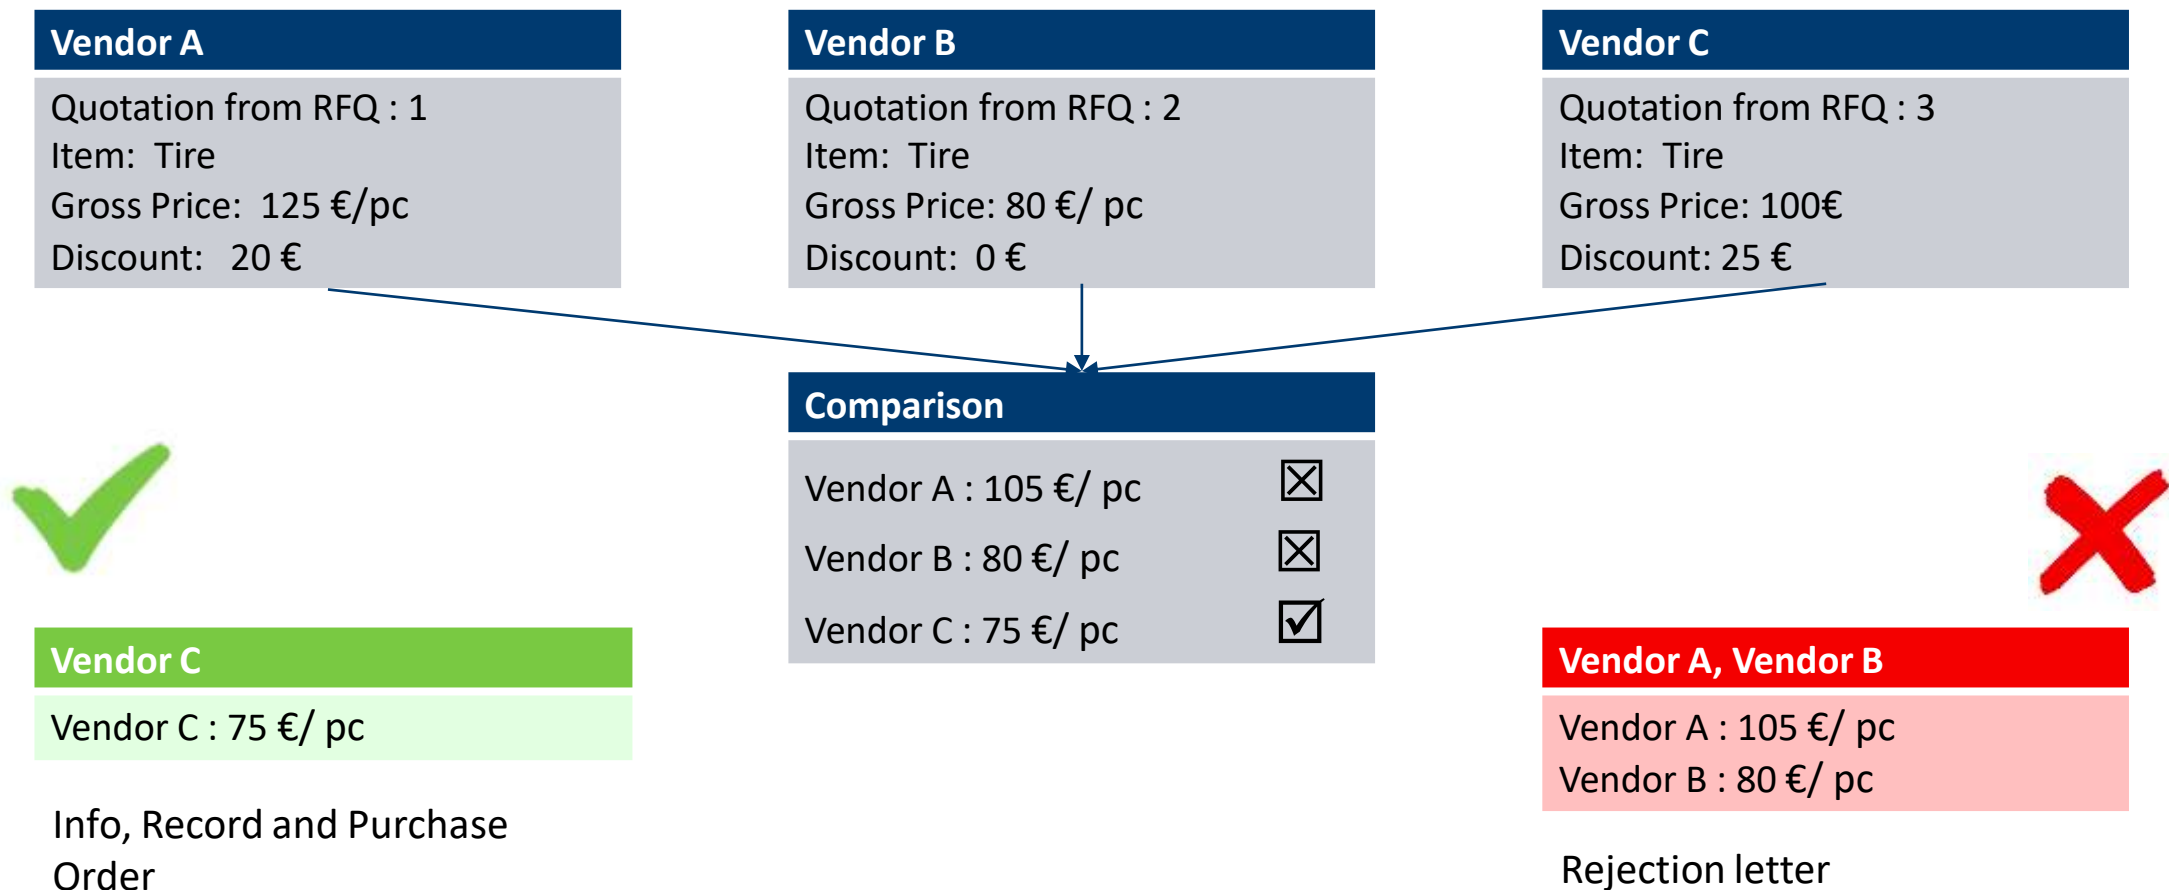

We can select which quotations will be compared by using the collective number we addressed before to be an important field that is maintained on RFQ (or directly on the quotation).

*Transaction **ME49***

# MAIN PURCHASING FLOWS

## 3- Vendor Selection and Comparison of Quotations

Sourcing vendors submits the quotation declaring the willingness to supply of goods and/or services

## 3- Vendor Selection and Comparison of Quotations

### Outline Agreement:

Vendor selection is an important process in the procurement cycle. Vendors can be selected by quotation process. After having shortlisted a vendor, an organization enters into an agreement with that particular vendor to supply certain items with certain conditions. Typically when an agreement is reached, a formal contract is signed with the vendor. So, an outline agreement is a long-term purchasing agreement with a vendor.

An outline agreement can be of the following two types

- Contract
- Scheduling Agreement

# MAIN PURCHASING FLOWS

## 3- Vendor Selection and Comparison of Quotations

### Contract

A contract is a long-term outline agreement between a vendor and an ordering party over a predefined material or service over a certain framework of time. There are two types of contracts

- **Quantity Contract** – In this type of contract, the overall value is specified in terms of the total quantity of material to be supplied by the vendor.
- **Value Contract** – In this type of contract, the overall value is specified in terms of the total amount to be paid for that material to the vendor.

## **3- Vendor Selection and Comparison of Quotations**

### **Scheduling Agreement**

A scheduling agreement is a long-term outline agreement between the vendor and the ordering party over a predefined material or service, which are procured on predetermined dates over a framework of time.

# MAIN PURCHASING FLOWS

## 4- Purchase Order Processing

| Vendor C       |     |          |
|----------------|-----|----------|
| Purchase Order |     |          |
| Mat            | Qty | Price    |
| Tire           | 10  | 75 €/ pc |

## 4- Purchase Order Processing

The Purchasing system adopts information from the requisition and the quotation to help you create a purchase order.

As with purchase requisitions, you can generate purchase orders or have the system generate them automatically using ME59n transaction.

Vendor scheduling agreements and contracts (in the SAP System, types of longer-term purchase agreement) are also supported.

After the approval, a purchase order is generated which is sent to the vendor to obtain the needed material. A purchase order holds details regarding the vendor's name, address, and date of delivery.

### *Transactions*

**ME21N** – Create **ME22N** – Change **ME23N** – Display

**ME59N** – Create a purchase order from a purchase requisition

# MAIN PURCHASING FLOWS

## 5- Purchase Order Follow-Up

The system checks the reminder periods you have specified and - if necessary - automatically prints reminders or expeditors at the predefined intervals. It also provides you with an up-to-date status of all purchase requisitions, quotations, and purchase orders.

After PO released ,PO reached the Vendor ( by any mean of print and then fax or by e-mail ). Then you can go for (ME92F) for Order Acknowledgement and then if so needed as in business by sending Reminders.

*Transaction*

**ME92F**

**ME2N**

## 6- Goods Receipt and Inventory Management

When the vendor processes the purchase order and delivers it to the concerned party, the process is called as goods receipt. Then, the authority verifies the quality and condition of the delivered items. After verification of the material, the receipt of the goods is posted.

Goods Receiving personnel can confirm the receipt of goods simply by entering the Po number. By specifying permissible tolerances, buyers can limit over- and under deliveries of ordered goods.

The Receipt of Good (GR) , done through **MIGO** or if it is a service entry done through **ML81N**.

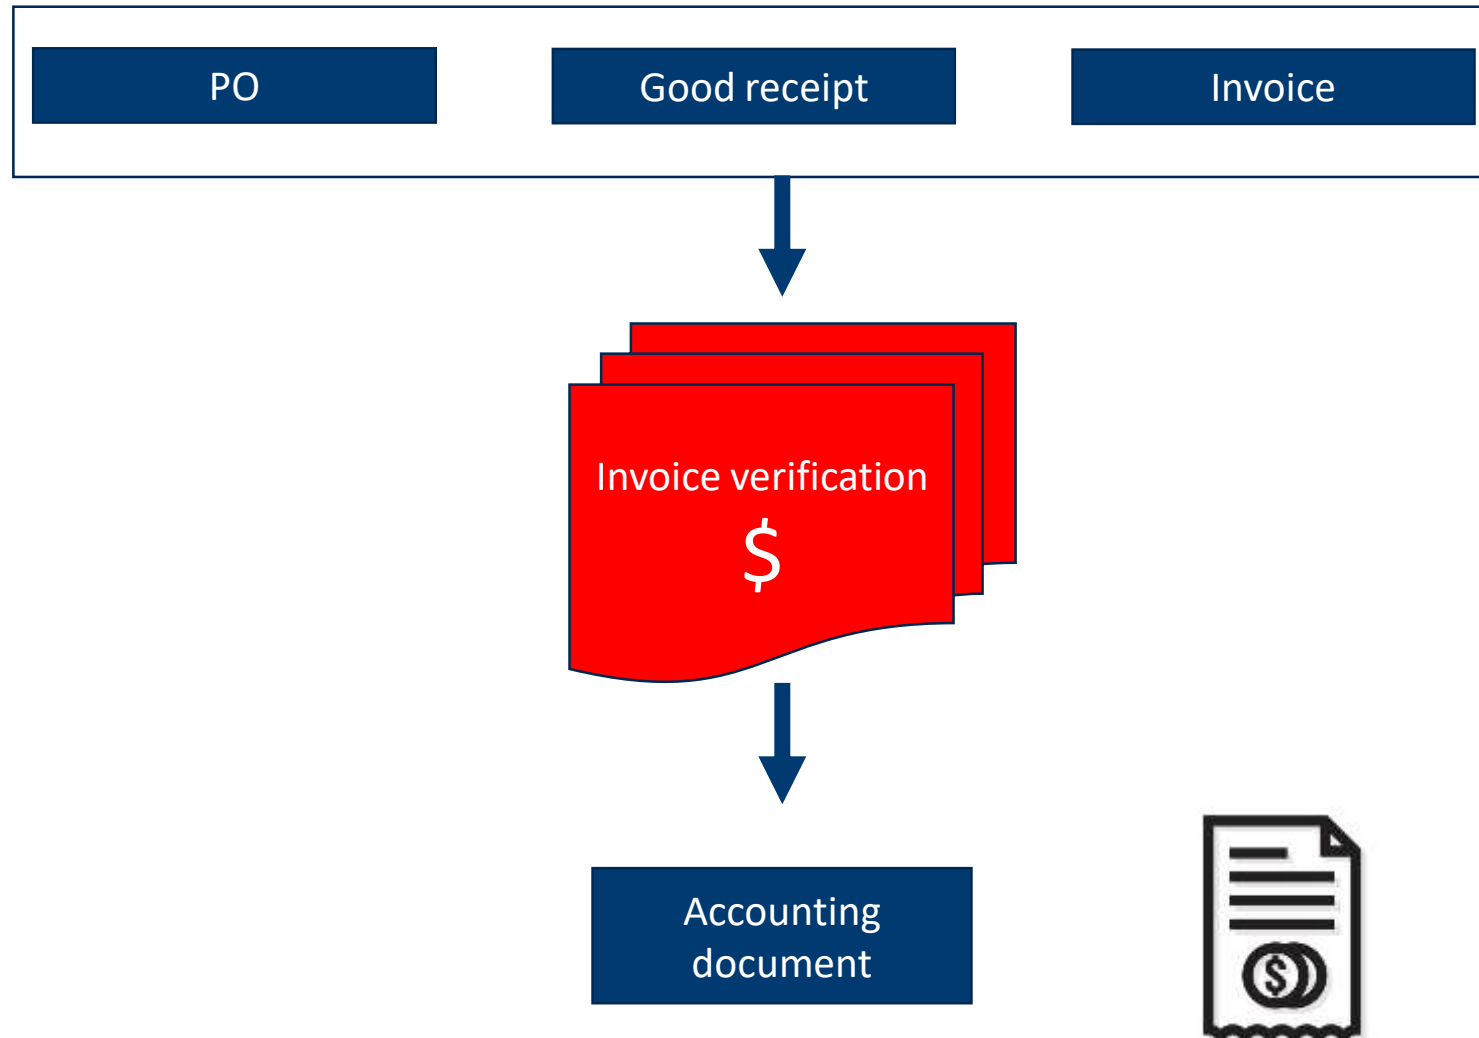

3 main stock types exist in SAP :

- Unrestricted stock
- Quality Stock
- Blocked Stock

*Transactions:*  
*MIGO, ML81N*

# MAIN PURCHASING FLOWS

## 7- Invoice Verification

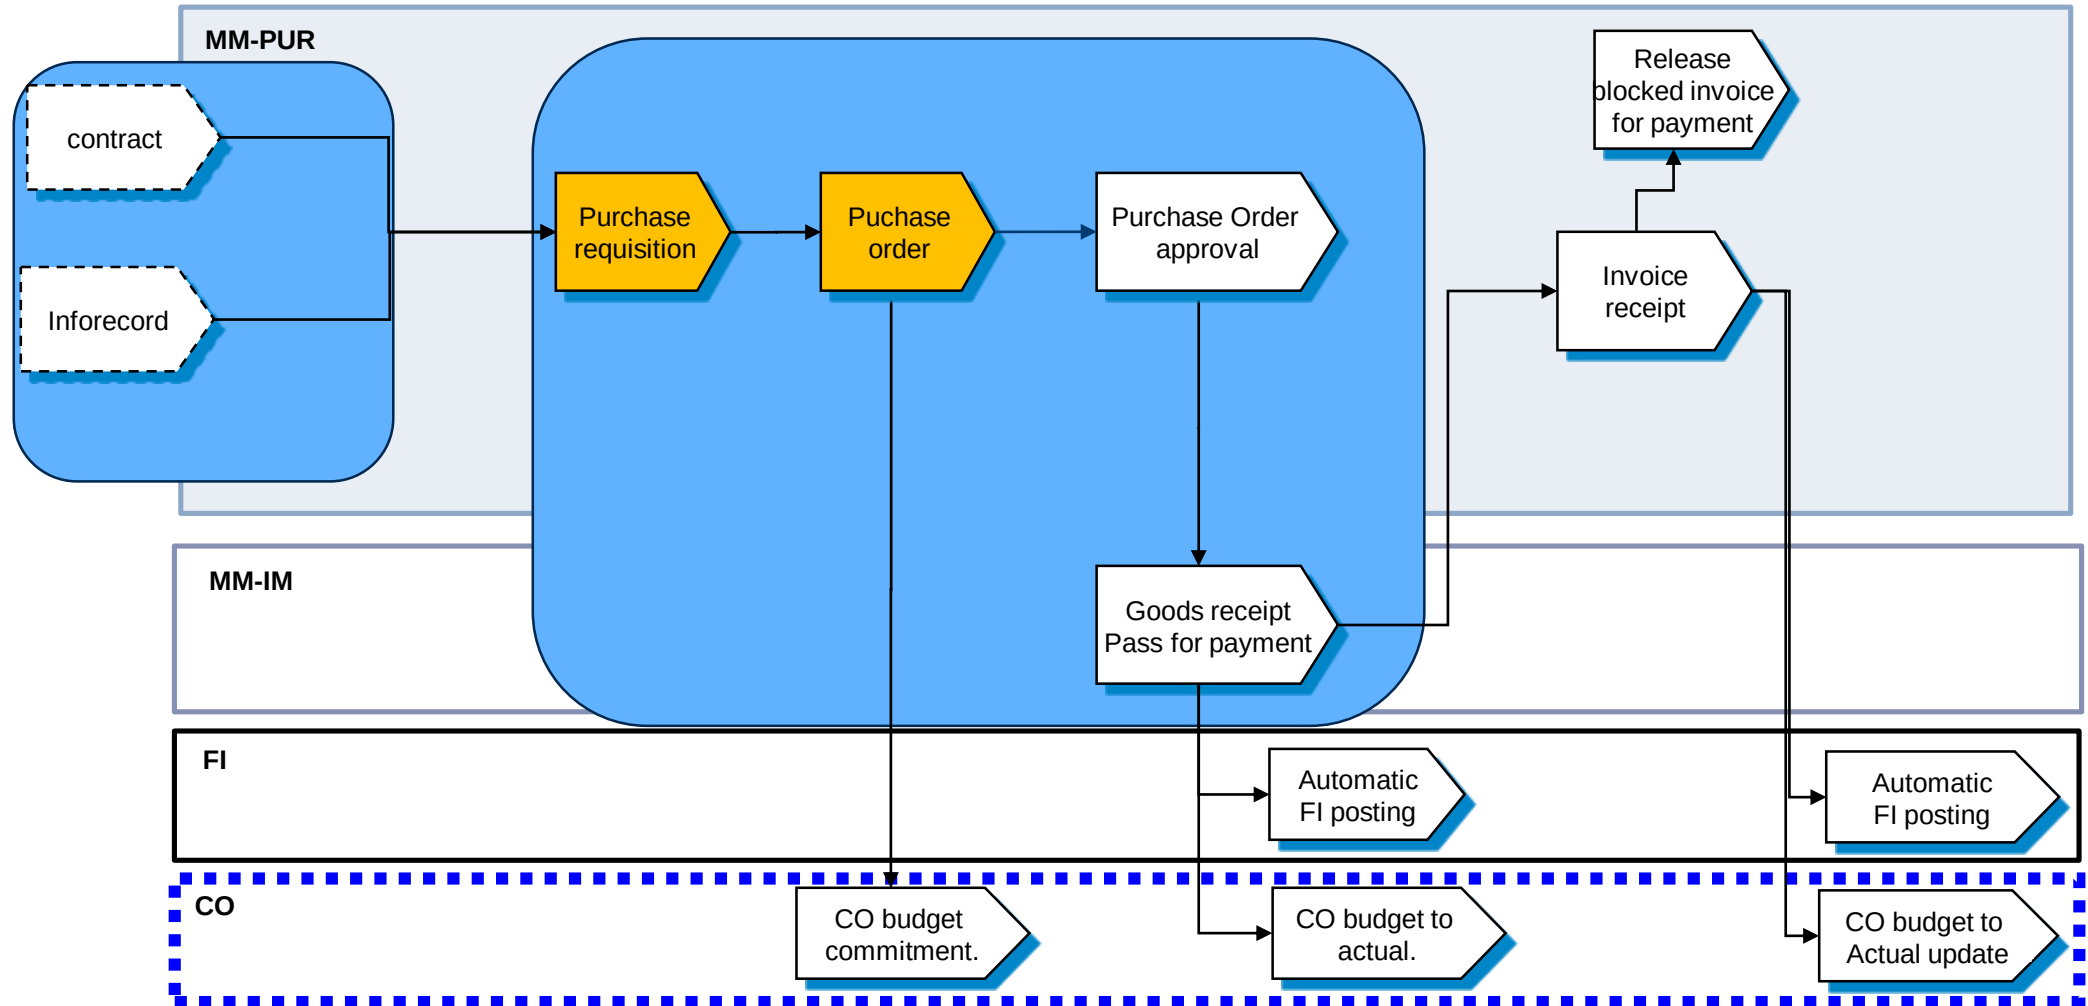

## 7- Invoice Verification

The invoice is sent by the vendor to the company. After getting the invoice, it is verified by the organization. Now, to make payment to the vendors an account determination in SAP MM is configured that makes the system automatically creates the G/L Account of the vendor that requires to be paid.

The system supports the checking and matching of invoices. The accounts payable clerk is notified of quantity and price variances because the system has access to PO and goods receipt data. This speeds the process of auditing and clearing invoices for payment.

*Transaction **MIRO***

# MAIN PURCHASING FLOWS

## ■ S/4 Hana Changes

# FIORI APPLICATION TO MANAGE PURCHASE REQUISITIONS

## Purchase requisition:

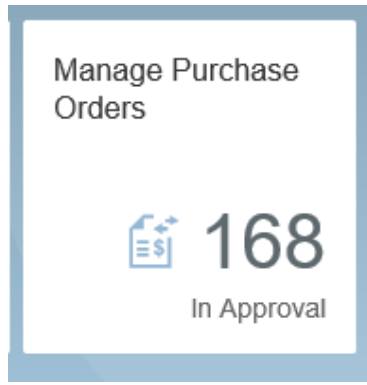

In SAP ECC system, the main transactions used to manage purchase requisitions are:

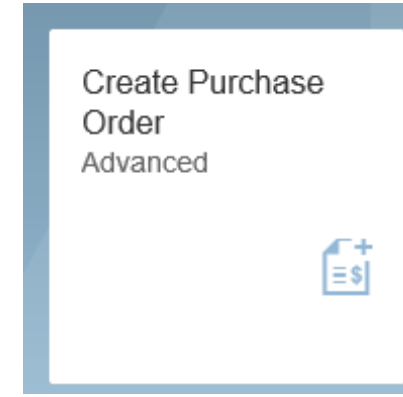

In SAP S/4 HANA, many tiles exist in standard :

# FIORI APPLICATION TO CREATE A PURCHASE ORDER

Create a purchase order

## Restrictions:

- For only purchase order type NB
- Only for material with cost center type 'K'
- History function possible using only invoice document

## Advanced Functions:

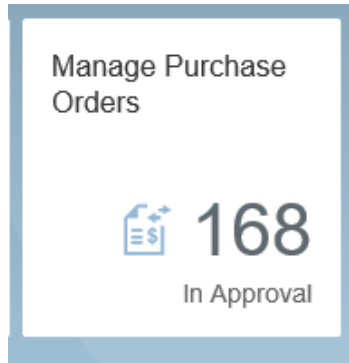

### Header

- Conditions
- Comments
- Addresses modification

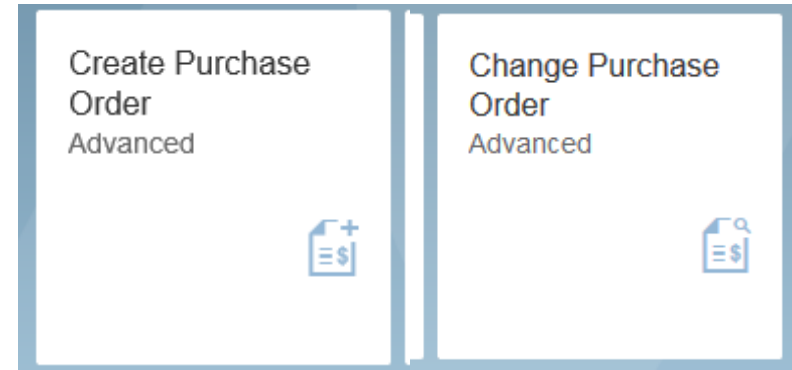

### Item line:

- Full History  
(payments, receptions, invoices)
- Comments

# FIORI APPLICATIONS TO MODIFY A PURCHASE

Manage a purchase order

Restrictions:

- Use to duplicate only simplified purchase order

Advanced functions:

- Enable to duplicate any types of purchase order

# FIORI APPLICATION TO VALIDATE PURCHASE OF SAP S/4 HANA

- Delivery returns are also permitted

# INVENTORY MANAGEMENT – STOCK RECEPTION

## Stock Reception:

Stock receipt using MIGO SAP transaction enables stock entry using a purchase order. Following stock movement, an accounting entry is also associated (generally many analytical entries) to indicate materials ownership.

MIGO transaction is also the stock movement that enables the vendor invoice.

SAP MIGO transaction screenshot showing the 'Général' tab. The 'Sais par' field is filled with '00013445'. The 'Date le' field is '05.02.2018 11:16:49'. The 'Code transaction' is 'Mouvement de stock: MIGO\_01'. The 'Ligne' table shows one line with 'ATTACHE CABLE'. The 'Article' tab at the bottom shows 'Qté en unité base' as '1', 'Qté en UVS' as '1', 'Qté de bon livraison' as '0,000', and 'Montant DE' as '16.410,00'.

Employee Self-Service interface with three buttons: 'Créer demande d'achat', 'Mes demandes d'achat', and 'Confirmer entrée de marchandises'.

# INVENTORY MANAGEMENT – INVOICE CONTROL

## Invoice Control

Invoice control indicates the end of the material procurement process since it involves supplier invoices posting received from a purchasing document (purchase order). The next steps of the process is strictly Finance responsibility as it involves carrying out the supplier payments process

Note: It is important it is also important to adress discrepancies between orders ans invoices. There is a possibility automatic blocking logic of invoices based on toelerance keys (**OMR6** transaction)
